Jeff Bezos Vision of a Trillion People in Space Colonies

In my series on building platforms for the endless growth of God's Kingdom a fascinating new development. Jeff Bezos the richest man on earth wants to build a space launch system to create space colonies for a trillion people.

Last week Jeff Bezos made an incredible presentation in Washington DC to a select audience of his long term plans to develop his space company, Blue Origin, as a low cost space launch system for future colonies in space. And he is putting his own money, a billion dollars a year, into making this happen.

This is important for the future development of God's plans for His church. My understanding of our Genesis 1;28 mandate is to subdue the earth...and space! My further understanding of God's Kingdom is that it grows forever (Isaiah 9:6). This is the reason why the Lord created more than a trillion galaxies...to be inhabited!

Yes this is long term project. But keep in mind what Jesus said "As in the days of Noah..." It took Noah 120 years to build a vessel to survive the destruction of his world and start a new civilization for a new world.

This is why we need to have a vision of a re-engineered church structure. We need to get beyond meetings and talking and start building and planning for a long term future for our grandchildren and their generations. The Bible says a righteous man leaves an inheritance for his grandchildren and the wealth of the world is laid up for the righteous.

The Lord made Mr. Bezos the richest man in the world for a purpose. He confesses that from an early age all he could dream about was space colonization and building a company one day that would finance such a dream. Well, God places dreams in the hearts of people and then He gives them the means to fulfill those dreams.

Next week I am going to write a blog on why we the church are the only ones capable of making use of Jeff Bezo's cheap launch systems to build this vision of space colonies. I will explain to you why the unrighteous are incapable of this long term task....and why we are!

But this week you have an assignment:

Look at Jeff Bezos presentation on Youtube and catch the vision of an exciting future!

<https://www.youtube.com/watch?v=GQ98hGUe6FM&t=2s>

Here below is the Daily Mail report of this important event along with some stunning photos from the Bezos presentation of his vision of what these future space colonies will look like...and in your spirit think...'New Heavens and New Earths'!

Revealed: Jeff Bezos' futuristic vision of self-sustaining habitats that could house a TRILLION people in space

- **Jeff Bezos outlined his vision of self-sustaining space colonies during secretive event in Washington DC**
- **He says this is still a long ways off, but could allow trillions of people to one day live in near-Earth space**
- **The concept was first posited in the 1970s by Bezos' former professor O'Neill, a Princeton physicist**

Last week, Amazon CEO Jeff Bezos finally lifted the veil on the lunar lander his aerospace company has been developing in secret for years, along with a plan to put humans back on the moon to stay.

And in the process, he also revealed an ambitious vision for space colonization.

Building off of a concept introduced decades ago by physicist Gerard O'Neill – who Bezos himself studied under during his time at Princeton, according to Fast Company – the Blue Origin founder outlined self-sustaining habitats that could hold entire cities, agricultural areas, and even national parks in space.

While such a future may still be a ways off, Bezos says it will be an 'easy choice' when faced with dwindling resources on Earth.

The habitats, reminiscent of the film *Interstellar*, could be built close enough to Earth to allow people to travel back and forth, and house 'a million people or more each.' And, according to Bezos, they'd have the 'ideal climate' at all times, 'like Maui on its best day, all year long.'

'These are beautiful, people are going to want to live here,' Bezos said. 'And they can be close to Earth so that you can return. Which is important, because people are going to want to return to Earth. They're not going to want to leave Earth forever. They're also going to be able to go between'

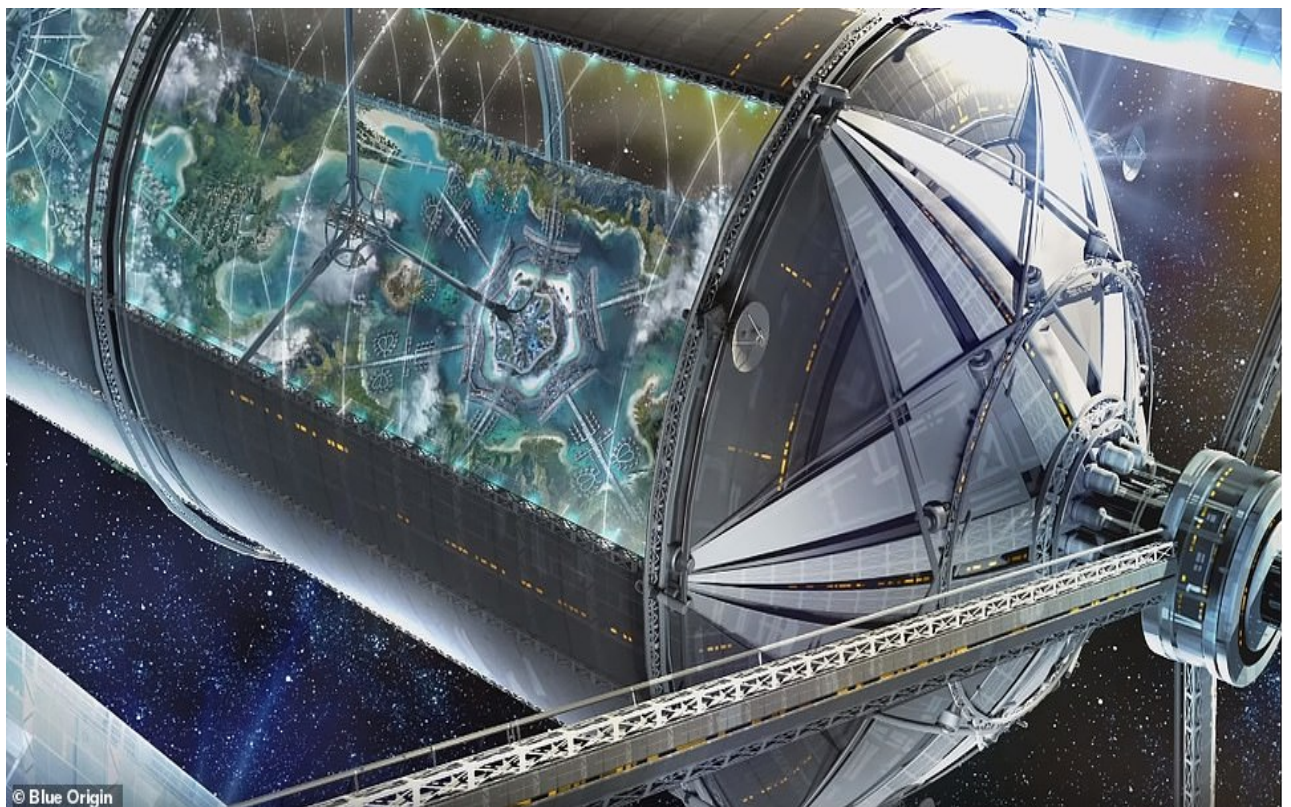

'We get to choose, do we want stasis and rationing, or do we want dynamism and growth?' Bezos asked during the invite-only event in Washington DC on May 9th.

'This is an easy choice. We know what, we want we just have to get busy.

'If we're out in the solar system, we can have a trillion humans in the solar system – which means we'd have thousands Mozarts and a thousand Einsteins. This would be an incredible civilization.'

The concept was first posited in the 1970s by Bezos' former professor O'Neill, whose proposed habitats would rotate in space to create artificial gravity based on centrifugal force.

'These are very large structures, miles on end, and they hold a million people or more each,' Bezos said

The concept was first posited in the 1970s by Bezos' former professor O'Neill, whose proposed habitats would rotate in space to create artificial gravity based on centrifugal force. Blue Origins' take on the design was on display at the secretive event

'Some of them would be more recreational – they don't all have to have the same gravity – they can have a recreational one that keeps it zero-g so you can go flying with your own wings.'

They may replicate cities on Earth or start from scratch with their own futuristic architecture, Bezos noted.

And, there would no rain, no storms, no earthquakes. 'These are beautiful, people are going to want to live here,' Bezos said. 'And they can be close to Earth so that you can return. Which is important, because people are going to want to return to Earth. They're not going to want to leave Earth forever. They're also going to be able to go between.'

According to Bezos, a trip between different space colonies would be as simple as 'a day trip.'

But, we still have a long way to go before the vision can become a reality.

'This is going to take a long time, this is a big vision,' Bezos said. 'The price of admission to do interesting things in space right now is just too high.'

According to Bezos, a trip between different space colonies would be as simple as ‘a day trip.’ But, we still have a long way to go before the vision can become a reality. ‘This is going to take a long time, this is a big vision,’ Bezos said. ‘The price of admission to do interesting things in space right now is just too high’

While the event started off with the elaborate concept images of self-sustaining space habitats with lush greenery and futuristic homes within its walls, the real star of the talk turned out to be something much closer to home – the moon.

On stage, Bezos took the wraps off a massive model of what will be the firm’s first lunar lander, dubbed Blue Moon.

‘This is an incredible vehicle, and it’s going to the moon,’ Bezos said, according to CNN, which live-blogged the event.

According to the CEO, the lander has been in development for the last three years and is on track for a 2024 crewed moon landing – falling in line with the five-year deadline revealed earlier this year by Vice President Mike Pence.

The plan could ultimately serve as a stepping stone for colonization of the moon and deeper space targets, Bezos suggested.
